

The 3-Tier Link Structure That Explains Indexation

Why most programmatic sites fail.

The structure

Home, then hub, then leaf. Every page reachable in three clicks or fewer.

Why it matters

Crawlers follow links. Buried pages get crawled late, indexed rarely.

The study link

Internal linking structure helped explain 61% of the variance in pSEO indexation.

The hub job

Hubs collect related pages and pass authority down to each leaf.

06 / 07

The trap

Flat sites with thousands of equal pages give a crawler no reason to prioritize any of them.

Do this

Map your site into home, hubs, leaves. Fix orphans first. Save this.
