

What IndexNow Does

IndexNow is a protocol that pushes your new and updated URLs to search engines in minutes instead of waiting for the next crawl cycle.

02 / 07

How It Works

You ping a single endpoint with your URL. Bing, Yandex, and other engines pick it up immediately. Google watches the file but does not index on ping alone.

Speed Advantage

Sites using IndexNow see indexing in minutes. Without it, even well-crawled pages can sit in the queue for days.

04 / 07

Who Supports It

Bing, Yandex, Naver, Seznam, and Yep all process IndexNow pings. Google monitors the submitted URL file for signals.

05 / 07

Implementation

Drop a verification file at your root, then ping the endpoint on every publish or update. Most CMS platforms have plugins that handle this.

06 / 07

590 Monthly Searches

Only 590 people search for this monthly. That means most SEOs have not adopted it yet. Early adopters gain an indexing speed edge.

Set It Up Tonight

It takes five minutes. Ping on publish, ping on update. Save this post for the API snippet.
